RENOLD

Strength through Service

Renold Gears has been manufacturing high quality, high specification gear units for over 100 years and has always been at the leading edge of gear technology with innovative products and power transmission solutions.

Interchangeability

Many of the products from Renold Gears are dimensionally interchangeable with other manufacturers gear units, allowing a trouble free replacement of gearboxes, in most cases upgrading the capacity through state of the art technology and materials.

Custom Made

Renold Gears is unique in it's ability to offer custom made products designed to meet customers exacting requirements without compromise on availability and cost. From complete package solutions to individual precision replacement gears, all can be tailor made to meet specific applicational requirements.

Available

The most popular ranges of gearboxes are available from local distribution stock, backed up by extensive stocks from our manufacturing plant in the UK.

RENOLD
Superior Gear Technology

Renold Couplings

Renold have been manufacturing flexible and rigid couplings, sprag and air clutches for over 50 years. The Renold Couplings factories are based in three global locations - Cardiff, Wales; Halifax, England and Westfield, New York, USA.

Renold Clutches and Couplings, Cardiff, Wales

In 1991 the company moved to a purpose-built factory in Wentloog, Cardiff, in which state-of-the-art machining and inspection facilities are to be found, all supporting a high level of personal customer care.

Service Excellence and Care

Renold offers a unique level of service excellence and customer care. Our experienced applications engineers will select the optimum solution, with the aid of the latest computer and design technology.

Specialist Solutions and Innovations

Renold is recognised throughout the industry for its capability to create specific solutions to customers unique requirements. International companies and industries, from steel to food processing to escalators to textile machinery, have chosen Renold to solve their problems.

Leading edge technology

Renold provides practical cost effective solutions with a commitment to value through quality. This is achieved by the continuous investment in people, process technology and manufacturing.

Consistent Reliability

Renold's 100 years of experience in the design and manufacturing of power

Renold Hi-Tec Couplings, Halifax, England

The Halifax factory (formally Holset Engineering Ltd.) became a member of Renold plc in 1996. The operation also includes the latest machining and tooling technology with integrated cellular manufacturing and complete testing and balancing capabilities.

transmission products to the highest specifications, with proven performance in diverse industries world-wide, underwrites the guaranteed quality and the assurance of reliability.

Renold Clutches & Couplings is BS EN ISO 9001:2000 approved. All products are designed and manufactured to this Quality Assurance System.

Renold Ajax, Westfield, New York, USA.

The company designs and manufactures custom gear spindles and gear couplings for the primary metals industry.

Testing

Although each of our factories manufacturing and testing demands vary, the following capabilities are available if the application demands it:

- Full scale radial and axial stiffness measurement.
- Torsional vibration analysis.
- Misalignment testing of couplings up to 2 metres diameter.
- Measurements of torsional stiffness up to 220 KNM.
- Static and dynamic balancing capabilities.
- Noise attenuation testing.
- Transient and finite element analysis.

The **RENOLD** organisation stretches worldwide: • 16 National Sales Companies • Over 70 Overseas Distributors
Offering the comprehensive **RENOLD** range of power transmission products directly or through local distributor networks

Typical Applications

Hydrastart

A fluid coupling suitable for soft starting high inertia machinery with reduced current demand, controlled acceleration and torque with drive overload protection.

- Conveyors
- Ball Mills
- Centrifuges
- Rotary Kilns
- Fans

Pinflex

A robust general purpose pin/buffer coupling, providing reliable fail safe transmission of torque and misalignment capability.

- Pumps
- Compressors
- Conveyors

Crown Pin

An established pin/buffer coupling offering extended power capacity where the demand for long life and simplicity of construction make it suitable for working in arduous conditions.

- Conveyors
- Pumps
- Cranes
- Washers
- Screens
- General Industrial Applications

Spider Couplings

Relatively low power but highly flexible coupling with halfbodies in either cast iron or bronze, making suitable for use in the food or chemical/pharmaceutical industries.

- Pumps
- Mixers
- Lube Systems

Gearflex

Heavy duty all metal couplings giving maximum power capacity within minimum space envelope and excellent misalignment capacity.

- Steelworks
- Quarries
- Mining

Typical Applications

Discflex

A general purpose, fail safe, torsionally flexible coupling offering the option of either urethane or reinforced rubber disc.

- Pumps
- Compressors
- Conveyors
- Mixers

Spiderflex

A medium powered, torsionally flexible coupling, combining shock absorbing and misalignment. Used in the widest range of industries and applications.

Tyreflex

A range of highly flexible couplings offering excellent misalignment capacity and suitable to absorb both shock loads and vibrations.

- Pumps
- Compressors
- Diesel engines
- Roller tables

Renoldflex

Renoldflex is a torsionally rigid coupling (TRC) that utilises a stainless steel spring disc pack to provide a positive “backlash free” drive.

- Pumps
- Compressors
- Packaging machines
- High temp boiler feeds
- Wind Turbines
- Petrochemical pump installations
- High speed general installations

Coupling customisation

Renold is able to offer a full customisation service across its complete range of coupling and clutch products.

Coupling Selection Guide

DRIVE POWER

Coupling Selection Guide

Flexible Couplings should be used to accommodate any combination of misalignment conditions described below.

At installation all couplings should be aligned as near to perfect as possible.

1. Angular

Angular misalignment is present when the shaft axes are inclined one to the other. Its magnitude can be measured at the coupling faces.

2. Parallel Offset

Axial misalignment is present when the axes of the driving and driven shafts are parallel but laterally displaced.

3. End float (axial)

End float is the ability to accommodate a relative axial displacement of the connected shafts; achieved by sliding members or flexing of resilient components.

4. Torsional flexibility

Torsional flexibility is a design feature necessary to permit shock and impulsive loadings to be suitably dampened. It is achieved by the provision of a flexible medium such as rubber, springs, etc., between the two halves of the coupling.

Selection

In order to select the correct type and size of coupling, the following basic information should be known:

Power to be transmitted

- Normal.
- Maximum.
- Whether continuous or intermittent.

Characteristics of the drive

- Type of prime mover and associated equipment.
- Degree of impulsiveness of driven load.

Speed in revolutions per minute

- At which normal power is transmitted.
- At which maximum power is transmitted.
- Maximum speed.

Dimensions of shafts to be connected

- Actual diameter.
- Length of shaft extension.
- Full keyway particulars.

Selection

When the input drive is not steady (i.e. not from an electric motor), and/or the driven load is impulsive, the actual power is multiplied by a Service Factor from the Table 2 (page 13).

Selection Procedure

- Nominal power in kW to be transmitted = K .
- Select appropriate load classification from Table 1, denoted as either S, M or H.
- From Table 2, establish Service Factor(s) to be applied, taking into account hours of operation/day and prime mover = fD .
- From Table 3 select factor for the required frequency of starts/hr = fS .
- Selection Power $K_s = K \times fD \times fS$
- Equivalent power at 100 RPM = $\frac{K_s \times 100}{\text{RPM}}$
- Check that coupling selected will accept the required shaft diameters. Should shaft diameter exceed maximum permissible, then re-select using next larger size of coupling.

Load Classification by Application

Key

S = Steady	(1) = Select on 24 hours per day service factor only.
M = Medium Impulsive	(2) = Use service factor of 1.00 for any duration of service.
H = Highly Impulsive	(3) = Use service factor of 1.25 for any duration of service.
* = Refer to Renold	(4) = Use service factor of 1.50 for any duration of service.

Note

Machinery characteristics and service factors listed in this catalogue are a guide only. Some applications (e.g. constant power) may require special considerations. Please consult Renold.

Service Factors and Selection

Table 2 Service Factor (f_D)

Prime mover (Drive input)	Driven machinery characteristics			
	Duration service hours/day	Steady load	Medium impulsive	Highly impulsive
Electric, air & hydraulic Motors or steam turbine (Steady input)	Intermittent - 3hrs/day max	0.90	1.00	1.50
	3 - 10	1.00	1.25	1.75
	over 10	1.25	1.50	2.00
Multi-cylinder I.C. engine (Medium impulsive input)	Intermittent - 3hrs/day max	1.00	1.25	1.75
	3 - 10	1.25	1.50	2.00
	over 10	1.50	1.75	2.25
Single-cylinder I.C. engine (Highly impulsive input)	Intermittent - 3hrs/day max	1.25	1.50	2.00
	3 - 10	1.50	1.75	2.25
	over 10	1.75	2.00	2.50

Table 3 Factor for Starts/Hour(f_S)

No of starts per hour	0-1	1-30	30-60	60-
Factor	1,0	1,2	1,3	1,5

Example of Selection

Coupling is required to transmit 7.5kW at 1440 RPM to connect an electric motor to a gear box driving a chain conveyor running for 18 hours/day and starting 15 times/hour. Shaft diameters /55mm respectively.

$$K = 7.5kW$$

From Table 1 Load Classification = M (medium impulsive)

From Table 2 Service Factor $f_D = 1.5$

From Table 3 $f_S = 1.2$

Therefore selection kW is:-

$$\begin{aligned} K_s &= K \times f_D \times f_S \\ &= 7.5 \times 1.5 \times 1.2 \\ &= 13.5 \text{ kW} \end{aligned}$$

$$\begin{aligned} \text{Equivalent power at 100 RPM} &= \frac{K_s \times 100}{\text{RPM}} \\ &= \frac{13.5 \times 100}{1440} \\ &= 0.9375kW @ 100RPM \end{aligned}$$

From page 17 selection is RSC110 (644911)
(maximum bore 55 mm).

Key Stress

1. Permissible key stress = 70N/mm²
2. Nominal torque $T_{KM} = k \times 9550 / \text{RPM Nm}$
3. Force at key $F = T_{KM} / r$
4. Shaft Rad r. metres
5. Key area $A = J \times \text{HUB length mm}$
(Obtain from relevant catalogue page).
6. Key stress $f_k = F/A \text{ N/mm}^2$
7. If resultant stress is less than 70 N/mm² key stress is acceptable.
If resultant f_k is greater than 70, consider either two keyways or extending hub length.
8. Example:

$$T_{KM} = 7.5 \times 9550/1440 = 49.7Nm$$

$$r = 55/2 = 27.5mm \div 1000 = 0.0275M$$

$$F = 49.7/0.0275 = 1741N$$

$$A = 16 \times 45 = 720mm^2$$

$$f_k = 1741/720 = 2.4M/mm^2$$
 Selection is therefore good.

For operation above 80% of the declared maximum coupling speed it is recommended that the coupling is dynamically balanced.

WARNING

It is the responsibility of the system designer to ensure that the application of the coupling does not endanger the other constituent components in the system. Service factors given are an initial selection guide.

WARNING

Rotating equipment must be provided with a suitable guard before operating or injury may result.

*Shallow key Depth. N.B. When ordering specify both bush number and bore size required.

Spiderflex

A medium power torsionally flexible coupling combining shock absorbing and misalignment capacity, used in the widest range of industries and applications.

Coupling capacity

- Maximum power @ 100rpm: 33kW
- Maximum torque: 3150Nm

Features and benefits

- Torsionally flexible - shock absorbing, extending machine life
- Maintenance free - minimum number of wearing parts
- Misalignment capabilities allowing flexibility in installation
- Cost effective - offering a low cost product with high quality design
- Dimensionally similar to other spider couplings - interchangeable
- Optional fire retardant anti-static elements for use in flameproof environment

- Taper bush bores available for ease of maintenance
- Compact design - small, with high torque capacity

Standard range comprises

- Shaft to shaft
- Flywheel to shaft
- Taper bush or parallel bore

Applications

- Bulk handling
- Compressors
- Generator sets
- Metal manufacture
- Pumps
- General industrial applications

General details

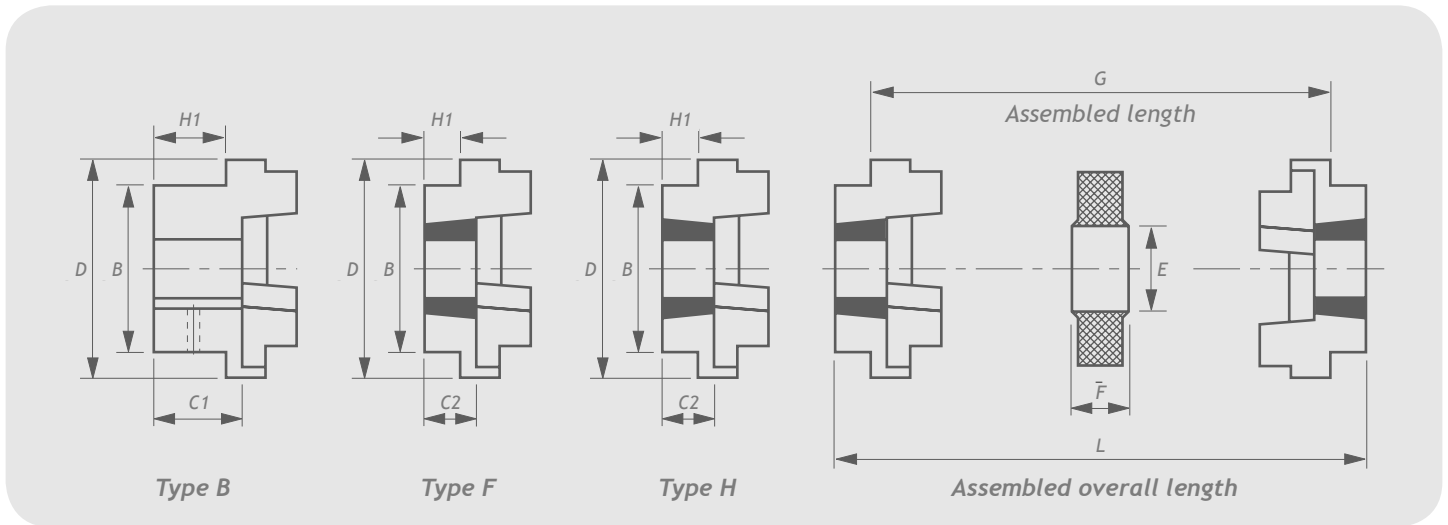

- Cast iron half bodies grade G220
- Standard element shore hardness A90
Temp range -30 to +100°C
- FRAS element shore hardness A78
Temp range -30 to +95°C

Can be certified for use in potentially explosive atmospheres containing gas or dust, according to ATEX directive 94/9/EC.

The couplings are classified for equipment group II, categories 2 and 3.

Contact Renold for further details.

1. At speeds exceeding allowable maximum speed, consult Renold.
2. Both moment of inertia and coupling weight have been calculated assuming fitting of taper bush of medium bore size.
3. For information on torsional stiffness, consult Renold.

* To avoid fouling spider, shaft length inside coupling half-body must not exceed this dimension.

Pinflex

A robust, general purpose pin/buffer coupling providing reliable fail safe transmission of torque and misalignment capability.

Coupling capacity

- Maximum power @ 100RPM: 340kW
- Maximum torque: 32500Nm

Features and benefits

- Steel half bodies, strong yet compact.
- Heavy duty pin and buffer coupling - for heavy shock load conditions.
- Torsionally flexible - shock absorbing, extending machine life.
- Maintenance free - minimum number of wearing parts.
- Misalignment capabilities allowing flexibility in installation.

- Common half bodies - minimise stock holding.
- Polyurethane buffers, reliable/ flexible and temperature resistant.
- Modular construction - available as coupling, brakedrum and shear pin designs.
- Taper bores available for ease of maintenance.
- Potential energy saving when used to replace older cast iron pin and bush couplings.

Standard range comprises

- Shaft to Shaft
- Shear Pin
- Brake Drum/Disc

Applications

- Conveyors
- Escalators
- Mixers
- Pumps
- General Industrial Applications

Construction details

Steel Half Bodies

Urethane Buffer: Temp Range -40°C to +80°C

Can be certified for use in potentially explosive atmospheres containing gas or dust, according to ATEX directive 94/9/EC.

The couplings are classified for equipment group II, categories 2 and 3.

Contact Renold for further details.

An established pin/buffer coupling, offering extended power capacity where the demand for long life and simplicity of construction make it suitable for working in arduous conditions.

Coupling capacity

- Maximum power @ 100RPM: 2611kW
- Maximum torque: 249,400Nm

Features and benefits

- Heavy duty coupling suitable for shock load conditions.
- Neoprene rubber buffers for robust flexibility.
- Torsionally flexible - shock absorbing, extending machine life.
- Maintenance free - minimum number of wearing parts.
- Misalignment capabilities allowing flexibility installation.

Standard range comprises

- Shaft to Shaft
- Shear Pin
- Brake Drum

Applications

- Conveyors
- Cranes
- Fans
- Leisure Rides
- Lifts
- Pumps
- Screens
- Washers
- General Industrial Applications

Construction details

Cast Iron Half Bodies

Neoprene Buffers:

Temp range - 30° to + 95°c

Tyreflex

A range of highly flexible couplings offering excellent misalignment capacity and suitable to absorb both shock loads and vibrations.

Coupling capacity

- Maximum power @ 100RPM: 65.8 kW
- Maximum torque: 6270 Nm

Features and benefits

- High misalignment capabilities - high flexibility.
- Shock absorbing - extending machine life.
- Maintenance free - minimum number of wearing parts.
- Fire retardant, anti-static elements available for use in a flameproof environment.
- Interchangeability means no re-engineering.

- Pump spacer option for easy pump maintenance.
- Taper bush bores available for ease of replacement.
- Easy replacement of tyre element without any need to move hubs axially on driven or driving shafts.

Standard range comprises

- Shaft to Shaft
- Pump Spacer Type

Applications

- Compressors
- Generator Sets
- Pumps

- Roller Table Drives
- General Industrial Applications

Construction details

Steel or S.G. Iron Half Bodies

Rubber Tyres:

Temp Range -50°C to +50°C

Chloroprene Tyres:

Temp Range -15°C to +70°C

Can be certified for use in potentially explosive atmospheres containing gas or dust, according to ATEX directive 94/9/EC.

The couplings are classified for equipment group II, categories 2 and 3.

Contact Renold for further details.

A general purpose fail safe, torsionally flexible coupling, offering the option of either urethane or reinforced rubber disc, as the flexible element.

Coupling capacity

- Maximum power @ 100RPM: 45kW
- Maximum torque: 4298Nm

Features and benefits

- Compact design, dimensionally small yet high power capacity.
- Torsionally flexible - shock absorbing, extending machine life.
- Maintenance free - minimum number of wearing parts.
- Misalignment capabilities allowing flexibility installation.
- Alternative flexible elements available for wide design choice.

- Optional fire retardant anti-static elements for use in flameproof environment.
- Taper bush bores available for ease of maintenance.

Standard range comprises

- Shaft to Shaft

Applications

- Bottling Machines
- Compressors
- Mixers
- Pumps
- Screens
- General Industrial Applications

Construction details

Cast Iron Half Bodies

Urethane Disc

Temp Range -40 to +80°C

Rubber Reinforced Disc

Temp Range -40 to +90°C

Chainflex

An all metal flexible yet torsionally stiff coupling, suitable for use in arduous working conditions.

Coupling capacity

- Maximum power @ 100RPM: 90kW
- Maximum torque: 8595Nm

Features and benefits

- Torsionally stiff for use as a positive drive connection.
- Easy installation for ease of maintenance
- Misalignment capabilities allowing flexibility in installation.
- Hardened teeth giving long life with high torque capacity.

- All metal coupling for use in hostile environments.
- Taper bush bores available for ease of maintenance.
- Easy removal of chain for high speed disconnection of driven and driving machines.
- Precision moulded plastic cover with seals for lubrication retention and dust protection.

Standard range comprises

- Shaft to Shaft
- Taper Bush or Parallel Bored

Applications

- Fans
- Feeders
- Kiln Dryers
- Line Shafts
- Pump Drives

Construction details

Hardened Steel Sprockets

Larger sizes are available.

* NOTE: Torque transmitted by F & H types is limited by the torque capacity of the taper bush.

NOTE: When connecting vertical shafts use type BB with keep plates or type FF. Type HF must not be used.

Ordering code

Renold Gearflex consists of both standard ranges and customised special all metal couplings, giving maximum power capacity within minimum space envelope and excellent misalignment capacity.

Coupling capacity

- Maximum power @ 100RPM: 50485kW
- Maximum torque: 4747000Nm

Features and benefits

- All carbon steel heavy duty gear coupling for strength in application, combined with long life.
- AGMA standard (DA/SA ranges) - interchangeable and cost effective.
- Single and double engagement types available, suiting all applicational requirements.
- Crowned and barrelled teeth for optimum contact and long life.
- Customised options available for all gearflex ranges to give design suitability for demanding applications.
- High misalignment up to 6°

Range options

- A series AGMA standard double and single engagement
- B series heavy duty standard double and single engagement
- D series high misalignment double and single engagement
- V series vertical
- NTS high speed
- A series double engagement flanged spacer (DAFS)
- A series double engagement carbon shaft
- Brake Disc/Drum
- Dis-engaging
- Long Hub
- Croft MB Series
- Mill Motor
- Shear Pin
- Telescopic

Applications

- Crane drives
- Mining
- Steelworks
- General heavy industrial applications

Construction details

Medium carbon steel half bodies and inner hubs.

'O' Ring sealing (A series)

Lip seals (D series)

Standard Gearflex products DA, HDB, SA, HSB and NTS can be certified for use in potentially explosive atmospheres containing gas or dust, according to ATEX directive 94/9/EC. The couplings are classified for equipment group II, categories 2 and 3.

Special conditions apply. Contact Renold for further details, or for consideration of ATEX certification of other Gearflex products.

Gearflex

Misalignment capabilities:

Double Engagement types

- Parallel Offset
- Angular
- Axial (End Float)

Single Engagement types

- Angular
- Axial (End Float)

Designed to meet the demands of today's wide ranging applications and manufactured to Renolds high standards.

Renold Gearflex Couplings feature an increased tooth capacity from optimised design, providing maximised power capacity within a given space envelope.

Contact us for more information on how we can deliver a cost effective solution to your application.

RENOLD Clutches & Couplings have the design and manufacturing capability to engineer a shaft coupling to suit customers special design application requirements.

Note: Croft MB series are also readily available in all variants. For details contact Renold.

When used in conjunction with a cardan shaft, two single engagement couplings will accept offset misalignment.

The amount will be dependant upon the cardan shaft length.

Misalignment angle per half (degrees)	Rating factor
1.50	1.00
1.00	1.15
0.75	1.30
0.50	1.55
0.00	2.00

Catalogue ratings shown are nominal values at 1.50 degrees. For values at misalignments less than 1.50 degrees:- Multiply nominal catalogue values by factor in table left.

e.g.
 GF6DA at 1.50° = 104668 Nm
 at 0.75° = 104668 x 1.30:-
 GF6DA at 0.75° = 136068 Nm

Long hub versions available. Contact Renold for details. See key stress calculations on page 13.

* Maximum Bore - The maximum bores shown are absolute maximums. Under normal circumstances the boss to bore ratio should not be less than 1.5 for standard applications. Consult Renold for overbore approval.

** Speed in excess of these shown may require additional balancing.

*** Hubs may be reversed to increase DBSE (F2 + F3 above). If axial movement is allowed with both hubs reversed, a stop plate should be fitted to prevent hubs disengaging from outers.

Ordering code

Gearflex High Misalignment D series Double Engagement type DD

D Series Double Engagement couplings accommodate offset, angular or combined misalignment.

Universally used for connecting industrial applications that are subject to higher than standard misalignment of the Gearflex DA, such as oil field equipment and rolling mill drives.

Induction hardened gear teeth and lip type seals handle up to 6° of misalignment.

Coupling size	Torque rating Nm	Bore A Max* mm	Dimensions								Mass kg	WR ² kg m ²	Offset (parallel) misalignment at

* Maximum Bore - The maximum bores shown are absolute maximums. Under normal circumstances the boss to bore ratio should not be less than 1.5 for standard applications. Consult Renold for overbore approval.

Max speed dependent on misalignment requirement, please consult Renold.

Specify misalignment angle ± 3.5° or ± 6°.

Gear Teeth are induction hardened.

Shrouded bolt flanges available if required.

Ordering code

Gearflex High Misalignment D series Single Engagement type SD

D Series Single Engagement couplings are commonly used in pairs with a floating shaft to connect widely separated equipment, accommodating offset, angular or combined misalignment.

Universally used for pinch roll, shear drives and tension bridles on auxiliary rolling mill equipment.

Coupling size	Torque rating Nm	Bore		Dimensions											Mass kg	WR ² kg m ²	Offset (parallel)

Long hub versions available. Contact Renold for details. See key stress calculations on Page 13. Renold can also supply cardan shaft assemblies.

* Maximum Bore - The maximum bores shown are absolute maximums. Under normal circumstances the boss to bore ratio should not be less than 1.5 for standard applications. Consult Renold for overbore approval.

** Speed max rpm dependant on length of spacer, please consult Renold.

*** For all orders please state length of spacer and speed required.

Type A - $L_b = L_a - 2 \times F$

Type B - $L_b = L_a - 2 \times F_2$

AGMA flange details - common dimensions

A torsionally stiff, backlash free coupling with misalignment capacity. Designed for use at high speeds and in high temperatures.

Torsionally rigid steel coupling

Renoldflex is a range of couplings that utilizes a stainless spring steel disc pack to provide a positive 'backlash free' drive.

The coupling consists of two carbon steel hubs that are connected to the disc packs with a system of micrometric precision bushings and high tensile steel screws. This construction provides a backlash free and torsionally rigid drive with the additional benefit of a 100% steel construction.

The Renoldflex range of couplings is based upon a modular component assembly; therefore it can be easily adapted to suit a wide variety of applications and design situations:

Coupling capacity

- Maximum power @ 100rpm: 482kW
- Maximum torque: 46000Nm
(Using HTT flexible elements)

Features and benefits

- Torsionally stiff - ideal for use on precision machines
- 100% maintenance free - long life with little wear
- Misalignment capabilities allowing flexibility in installation
- Zero backlash guarantees operational accuracy

- High operating temperatures, suitable for harsh operating environments and temperatures up to 240°C
- Taper bored and cone clamp hubs also available
- High transmissible torque (HTT) flexible elements available from size 70 up
- High operating speeds

Standard range comprises

- Shaft to Shaft
- Spacer type

The Renoldflex type A uses a single disc pack and two hubs. It permits both axial and angular misalignments. This arrangement guarantees the highest torsional stiffness for this range of couplings. A special vertical support can be produced to allow for vertical or inclined mounting of the type A arrangement.

The Renoldflex type B uses two disc packs, two hubs and a spacer. It permits axial, angular and radial misalignments. The spacer component can be supplied in several lengths to allow for different axial dimensions.

Applications

- Pumps
- Fans
- Blowers
- Material handling
- Servo motor drives
- Machine tools
- Presses
- Cranes
- Wind turbines
- General industrial applications

General details

- 100% steel construction
- Steel hubs
- Stainless steel laminated flexible elements

Can be certified for use in potentially explosive atmospheres containing gas or dust, according to ATEX directive 94/9/EC.

The couplings are classified for equipment group II, categories 2 and 3.

Contact Renold for further details.

Renoldflex

[fig 02] Misalignment diagram

[fig 03] Misalignment factor f_1

Note: Allowance should be made for change in misalignment encountered during operation. e.g. due to thermal expansion.

[fig 04] Temperature factor f_2

For applications with temperatures over 80 °C this must be stated on order.

Renoldflex coupling size selection

In order to select the most suitable sized coupling, a number of service factors must be taken into consideration. These service factors make adjustments to the design torque (T) of an application to take into account factors such as misalignment, load classification, driver classification as well as high ambient temperatures to produce a selection torque (T_s , where $T_s = T \times f_s$). The most suitable coupling is then selected by comparing the selection torque (T_s) and the couplings nominal torque (T_N). Please note - it is important to ensure that the coupling selected will accept the required shaft diameters. Should shaft diameter exceed the maximum permissible then a larger coupling should be selected.

The total service factor $f_s = f_1 \times f_2 \times f_3$; where f_1 is the misalignment factor, f_2 is the load classification factor and f_3 is the temperature factor. Note; the load classification factor is weighted depending upon the prime mover classification. These service factors are defined below:

Misalignment factor f_1

The maximum misalignments quoted within the technical data for the Renoldflex coupling range cannot be present at the same time. Therefore, the presence of any axial misalignment Δ_{ax} reduces the possibility for offset misalignment Δ_{rad} and angular misalignment Δ_{ang} , which can be seen in [fig 02]. The combined total angular misalignment Δ_{TOT} is a function of the angular misalignment Δ_{ang} and offset misalignment Δ_{rad} of the shafts, according to the following formula:

$$\Delta_{TOT} [^\circ] = \frac{\Delta_{ang}}{2} + \arctan \left(\frac{\Delta_{rad}}{(H-B)} \right)$$

The values H and B [mm] are given in the overall dimensions table. The misalignment factor f_1 is a function of Δ_{TOT} as shown in [fig 03].

Load factor f_2

The following load factors apply for machines operated by electric or hydraulic motors as well as steam or gas turbines.

OPERATING MACHINE	load factor f_2
Blowers: low inertia	1.1
Blowers: high inertia, cooling towers	2.0
Centrifugal pumps: low inertia and light liquids	1.1
Centrifugal pumps: high inertia or semi-liquid materials	1.75
Conveyors	1.5
Elevators and cranes	2.0
Gear pumps	1.5
Machine tools: auxiliary drives	1.1
Machine tools: main drives	1.75
Mills	2.5
Paper machines and textile machines	2.0
Presses	3.0
Reciprocating pumps	2.5
Woodworking machines	1.5

For machines operated by alternative prime movers the load factor f_2 must be adjusted as follows:

- f_2+1 for machines operated by IC engines with 4 or 5 pistons.
- $f_2+0.5$ for machines operated by IC engines with 6 pistons, hydraulic turbines or with a start torque >2 .
- The following must be taken into account with regard to repetitive high peak torque applications:
 - For non reversing duty: $T >$ Peak torque
 - For reversing duty: $T >$ 1.5 Peak torque.

Temperature factor f_3

Renoldflex couplings are unaffected by temperatures up to 160 °C. For applications with higher temperatures, the temperature factor f_3 seen in [fig 04] must be taken into consideration.

Renoldflex Type A

[fig 05] Balancing

Renoldflex Type B

[fig 06] Balancing

Balancing; Renoldflex standard elements are balanced to grade G6.3 - BS ISO 1940-1:2003. Additional balancing is recommended for applications over the speed curves in [fig 05] and [fig 06].

* Renoldflex allows 1.75 times the nominal torque for short periods of time.

** See [fig 05] & [fig 06].

*** The torsional stiffness of a single pack complete coupling can be approximated to the torsional stiffness of 1 disc pack C_k

The torsional angle of a single pack coupling

$$[\text{°}] = \frac{180}{\pi} \frac{T}{C_k}$$

The torsional stiffness of a complete double pack coupling can be approximated to:

$$C_{TOT} = \frac{1}{\frac{2}{C_k} + \frac{H-2B}{C_h}} \quad H, B - \text{see catalogue overall dims}$$

The torsional angle of a double pack coupling

$$[\text{°}] = \frac{180}{\pi} \frac{T}{C_k}$$

Hydrastart Fluid Coupling

A fluid coupling suitable for soft starting high inertia machinery with reduced current demand, controlled acceleration and torque with motor overload protection.

Coupling capacity

- Maximum power @ 1500RPM 600kW
- Maximum torque: 3500RPM

Features and benefits

- High inertia controlled torque to 700 kW.
- Soft start - motor starts on low load.
- Allows use of standard squirrel cage motors.
- Overload protection - fusible plug safeguards equipment.
- Dampens torsional vibration, reducing mechanical stress - extends machine life.
- Delay fill version - extends acceleration time and reduces start-up torque.
- Can match load and speed on multi drives.

- Energy saving through reduced current demand at start-up.
- Coupling and V pulley types - design flexibility.

Operating principles

The coupling is partially filled with hydraulic oil to a level suitable for the absorbed power of the application and the acceleration characteristics of the driven machinery. The optimum oil fill is that which just allows the driven machine to accelerate from rest, thus providing the best drive overload protection.

Power is supplied to the input side of the coupling by either an electric motor or diesel engine. This causes the driving impeller (A) [fig 07] to be rotated at motor speed, oil is thrown outwards by centrifugal force. The flow of oil is directed across the blades of the impeller towards the opposing turbine (B). Kinetic energy is absorbed by the turbine and translated into torque, which is always equal to the input torque and produces rotation of the output member (in the same direction as the driver).

The low resistance of the impeller at start up allows the motor to quickly accelerate to full speed. The driven load accelerates smoothly to within a small percentage of the motor speed.

This speed difference is referred to as slip and must always be present for the successful operation of a fluid coupling.

Typical values of slip will vary between 2% (large power) and 6% (small power).

All hydraulic couplings can be driven in either directions of rotation.

The input and output positions shown are standard, but the input can be from either side of the coupling.

The standard drive arrangement allows the outer cover to be rotated whilst at rest to facilitate oil filling.

However, if a brake drum or disc brake is fitted, the brake should be at the coupling output. See page 65.

To calculate slip %

$$\frac{(\text{Input speed} - \text{output speed}) \times 100}{\text{Input speed}}$$

Delayed Fill

Hydrastart Delayed Fill Chamber (Type HS...R)

HydraStart (constant fill) hydraulic couplings having a maximum oil fill will limit the starting torque to approximately 200% of nominal torque. It is possible to reduce this figure by reducing the quantity of oil in the circuit.

The disadvantage of this method is that it produces increased slip and higher operating temperatures. To overcome these

problems a delay fill chamber is available on sizes HS8 and above.

This chamber is a modular option and allows a calibrated oil feed into the working circuit. In this way, starting torque can be reduced whilst minimising slip under normal running.

At rest [fig 08]

With the drive at rest, oil drains from the working circuit into the delay chamber.

Accelerating [fig 09]

At start up the coupling will transmit limited torque, allowing the motor to reach rated speed quickly. Oil flows from the chamber to the working circuit proportionally to the speed.

Running [fig 10]

When the coupling achieves its rated speed, almost all of the oil is in the working circuit and the torque is transmitted at the minimum slip value.

CAUTION

The outer case of the Hydrastart coupling can become hot during operation. Do not touch the coupling or a burn may result.

CAUTION

Do not attempt to change the coupling oil during or soon after operation has ceased, as the oil may be hot and could cause burns.

'Soft' Starting

Effect of starting on electric motors

If a machine is driven by a squirrel cage motor without the use of a HydraStart fluid coupling, the following conditions arise [fig 11].

1. Motor will pull out 250/280% FLT.
2. Motor will consume 6 times FL amps.
3. Increase in motor temperature.

Star-delta starting reduces overheating. However, the starting torque in star is only 30% that in delta and it is often necessary to use larger or more complicated wound motors, particularly with high inertia machinery.

- A = Locked rotor torque
- B = Stall torque 250/280%
- C = Normal torque 100%
- I = Amperage

Effect of starting of electric motors when fitted with HydraStart Couplings

When a drive includes a HydraStart coupling the motor starts on low load, with only an instantaneous current peak at switch on [fig 12]. At start up all the motor torque is available to accelerate the motor rotor and coupling impeller (pump).

The driven impeller (turbine) increases speed smoothly from zero rpm until the 100% slip curve intersects the motor torque curve at approximately 85% motor speed [fig 13]. When the torque developed by the HydraStart coupling matches the resisting torque of the driven machine, acceleration of the load commences and continues up to running speed which will be between 94% and 98% of the driving speed depending on the coupling size.

HydraStart couplings fitted on diesel engines

HydraStart fluid couplings can be used with all types of industrial machinery driven by internal combustion engines. [fig 14] shows typical engine and coupling performance curves.

The horizontal curve represents the engine's torque curve whilst the vertical shows the torque capacity of the coupling for different slip values and speeds. As load on the driven shaft increases it demands torque, causing the coupling to slip at higher level.

If still greater loads are demanded then the coupling will eventually slip at 100%. Note this does not happen until the engine has developed peak torque.

Thus by using a fluid coupling, it permits an engine to develop maximum torque without stalling under load and promotes rapid acceleration to normal load speed.

Hydrastart Selection Chart

Larger coupling sizes are available up to 2000kW at 1400 RPM

This chart may be used for the selection of coupling size. If your selection falls on a dividing line, always select the next largest size and use reduced oil fill.

Hydrastart couplings can be used for up to five equi-spaced starts per hour.

Applications requiring more than five starts an hour should always be referred to Renold.

NOTE: Hydraulic couplings will not compensate for an under-sized electric motor.

WARNING

Rotating equipment must be provided with a suitable guard before operating or injury may result.

WARNING

It is the responsibility of the system designer to ensure that the application of the coupling does not endanger the other constituent components in the system. Service factors given are an initial selection guide.

Coupling Rating Tables

Maximum rating table

Coupling ref	Motor speed / kW

Standard Available Options

Non delay fill

Type: HS..PF

Description

Basic coupling

Sleeve bored to suit motor shaft and incorporating Pinflex output coupling. Capable of accepting some misalignment. Flexible buffers can be replaced in situ.

Page 64

Delay fill

Type: HS..RPF

Type: HS..B

Brake drum options

Basic Pinflex coupling with the addition of a brake drum, metric or inch sizes.

Page 65

Type: HS..RB

Type: HS..K

Brake disc options

Basic Pinflex coupling with the addition of a brake disc, metric or inch sizes.

Page 65

Type: HS..RK

Type: HS..GF

Basic coupling incorporating two Flexible Gear half couplings

Capable of accepting some misalignment and allowing removal of HydraStart coupling without displacing either motor or driven shaft. Brake drum or disc options available.

Page 66

Type: HS..RGF

Type: HS..VP

Vee Pulley Mounting

Sleeve bored to suit motor shaft. Pulley is attached using external bolts and may easily be replaced.

Page 67

Type: HS..RPV

Type HSPF, HSB, HSK and HSVP may be used for vertical applications. Please contact Renold for details.

Overload Protection

When a hydraulic coupling experiences overload there is a correspondingly high slip value accompanied by a rise in the oil temperature. To prevent damage to the drive there are three options available.

1. Fusible plug

This is fitted as standard on all HydraStart couplings sizes 4 and above. The standard plug is set to fuse at 138°C. Another option available allows fusing at 183°C. Because oil is discharged when the plug fuses it is advisable to correctly guard couplings using this type of device.

2. Thermal trigger

Fitted as an option on HydraStart couplings sizes 6 and above, this device prevents oil being discharged from the coupling at overload. As with the fusible plug, two melt temperatures are offered. When melt point is reached a pin is released which engages with a limit switch. The signal from this switch can operate an alarm or switch off the electric motor to protect the drive. After the cause of the overload has been removed the drive can be restarted after replacing the thermal trigger.

3. Non-contact sensor

Non-contact speed and heat sensors can be supplied which shut down the drive in the event of overload. Please contact Renold for more information.

HydraStart thermal trigger

Size	A	L	Li
HS6	345	93.7	21.5
HS8	422	123.2	20.0
HS10	511	146.1	16.0
HS11	580	144.5	10.5
HS12	669	173.3	10.5

Operating principles

This device will trigger the limit switch if the oil temperature reaches a predetermined level without loss of oil from the coupling. Fusible trigger plug 117°C alternatively 138°C.

Electrical characteristics

2-Pole 1N/C + 1N/O, conforms to IEC 529 IP 66, contact type XCK rating 500V AC-15

3-20mm ISO Cable Entries.

The best range of solution chain products available anywhere

RENOLD **Synergy**™

- High performance
- Superior wear life
- Outstanding fatigue resistance

RENOLD **Syno**™

- Maintenance free
- Self-lubricating chain
- Food industry-approved lubricant

RENOLD

- Best premium chain
- Leading performance
- Solid bush / solid roller / end softened pin

Hydro-Service™

- Superior corrosion resistant coating
- Alternative choice to stainless steel chain
- Will not chip or peel
- Hexavalent chrome-free

Steel Pin Bush Roller Chain

- Manufactured to international stds
- Full range of pitch alternatives
- Breaking loads 13 to 900 kN as std
- Attachments to suit varied applications

Leaf Chain

- Comprehensive ranges used worldwide for safety critical lifting applications
- 100 years experience in developing and maintaining lifting chain

Steel Knuckle Chain

- Heavy duty, detachable elevator chains
- Integral K type attachments
- Breaking loads from 642kN to 1724kN
- Sealed joint to extend chain life

Roll-Ring™

- Revolutionary chain tensioner
- Installed in seconds and self adjusting
- Maintenance free
- Also acts as noise damper

Customised Engineering Chain

- Wide range to suit specialised applications using high specification materials and treatment processes
- Designed in close collaboration with customer

Smartlink™

- Load monitoring technology
- Technical reports & data logging
